

# JS

It is possible to generate test suites outside of the jUnit runner with JavaScript. Note, that this manual does not cover how to create a request. To learn more about it, please refer to the 'browser.pdf' file.

## 1) Installation

First, the keystore must be disassembled into separate files with the following commands:

- openssl pkcs12 -in security.p12 -out client.pem -clcerts -nokeys
- openssl pkcs12 -in security.p12 -out key.pem -nocerts

Note, that all passwords, required during the procedure, are defined as 'changeit'.

To run the code you must also install Node.js (<https://nodejs.org/en/download/>).

## 2) Using the code

The request is enclosed in the file 'index.js', please adapt it to your needs. To run the code:

- npm install
- node index.js
