C#

It is possible to generate test suites outside of the jUnit runner with C#. Note, that this manual does not cover how to create a request. To learn more about it, please refer to the 'Browser.pdf' file.

1) Installation

To run the code must install the .NET framework and the .NET core (https://dotnet.microsoft.com/download). The keystore, named 'keystore.p12' must be placed in the current directory.

2) Using the code

The request is enclosed in the file 'src/EcFeedExample/Program.cs', please adapt it to your needs. To change the response type or to change the keystore name and location, edit the 'src/EcFeed/EcFeed.cs' file.

To build and run the code, run the following commands in the 'src/EcfeedExample' directory:
- dotnet build
- dotnet run
